75%	30%	5+	B2→C1
reduction in processing costs with AI	less delivery time in automated flows	functional projects with AI APIs in production	English actively in progress

PROFESSIONAL PROFILE

Artificial Intelligence Engineer (ESCOM IPN) with hands-on experience in intelligent process automation, generative AI API integration, and cross-platform application development. I have built workflows combining language models (OpenAI GPT-4, Google Gemini, WAN2GP) with conditional logic and local AI to automate real-world processes, achieving measurable reductions in cost and delivery time.

Currently deepening knowledge in offensive and defensive security applied to AI systems (Ethical Hacker – Cisco Netacad), with the goal of designing secure and robust agents for enterprise environments. I align with Companies values: quality, agility, measurable client impact, and digital transformation built on solid foundations.

I am looking for a first formal position where my skills in automation, applied AI, and security generate value from day one — not in three months.

PROJECTS & RELEVANT EXPERIENCE

AI Developer · Local AI – OpenAI APIs – Google Imagen 4 APIs *2023 – 2024 | Independent*

Development of automated solutions integrating language models and computer vision for content generation.

- **▼ 75% cost:** Designed a unified pipeline combining Google Imagen 4, GPT-4, and WAN2GP, optimizing latency and budget compared to multi-provider architectures, especially for video generation.
- **Prompt Engineering:** Automated the creation of educational scripts by designing structured prompts with strict context, tone, and format parameters in GPT-4.
- Evaluated and compared models by use case: speed, output quality, and cost per token — data-driven decisions, not preference.

AI Automation Developer · Independent Project — Content Generation *2023 – 2024 | CDMX*

Design and implementation of an intelligent automation pipeline for marketing content generation on social media, combining multiple AI APIs.

Generative AI process automation

- **▼ 30% time:** Designed n8n workflows with conditional logic in Python and JavaScript, integrated with OpenAI GPT-4 (text) and Google Imagen 4 (images) for automatic content generation.
- Implemented data-based triggers to activate content generation based on configurable parameters, eliminating manual intervention in the production process.
- **▼ 40% cost:** Connected Google Imagen 4 and GPT-4 APIs into a unified pipeline, reducing processing costs compared to manual flows.

Monitoring and performance metrics

- Built Power BI dashboards to measure automated pipeline performance: generated content volume, cycle time, and error rate per workflow.

Back-End Developer & Project Manager · Cross-Platform Applications — Team of 5

2023 – 2024 | CDMX / ESCOM IPN

Led the development of two applications (web + Android) with a shared SQL database, applying agile methodologies to coordinate a team of 5 developers.

Architecture & development

- **▼ 30% response time:** Designed the shared SQL database architecture between the web platform and Android app, ensuring data integrity and consistency in concurrent queries.
- Led sprint planning, task assignment, and code review for a 5-person team using SCRUM methodology, delivering both applications on time.
- Implemented Google Maps SDK and Firebase integration for real-time GPS tracking of pets with a veterinarian-patient communication channel.

Management & quality

- Used Git/GitHub for parallel version control across team members, avoiding code conflicts and maintaining a clean history of changes.

SECURITY APPLIED TO AI SYSTEMS

The companies operates under ISO 27001 certification in information security. I am building competencies in offensive and defensive security to apply them directly to the protection and hardening of AI agents and systems in enterprise environments:

- **Ethical Hacker — Cisco Networking Academy (Netacad):** study of attack vectors, system vulnerabilities, penetration testing techniques, and their application to detecting flaws in AI agent architectures.
- Practical application to agent design: identification of prompt injection, jailbreaking, and data exfiltration as LLM-specific attack vectors — and how to build guardrails against them.
- **NVIDIA DLI — Fundamentals of Deep Learning (in progress):** technical foundation to understand the limits of the models being protected.

The combination of AI process automation + offensive security is exactly the profile that digital transformation companies need to implement AI responsibly.

TECHNICAL STACK

AI & LLMs	OpenAI GPT-4 · WAN2GP local · Google Imagen 4 · Prompt Engineering · GenAI Automation
Automation	n8n (conditional logic flows) · Python scripts · JavaScript · REST API Integration
Cloud & Data	Firebase (real-time) · Google Maps SDK · Power BI · SQL · Google Cloud APIs
Development	Python · Java · JavaScript · HTML/CSS · React · Node.js · Git/GitHub
AI Security	Ethical Hacker — Cisco Netacad (in progress) · AI Agent Hardening · OWASP Fundamentals
Methodologies	SCRUM · Agile · Kanban · Lean Startup · Design Thinking · Project Management

EDUCATION & CERTIFICATIONS

EDUCATION **Artificial Intelligence Engineering** ESCOM — National Polytechnic Institute (IPN) 2024 – Present **Technical Degree in Programming** CECyT 9 'Juan de Dios Bátiz' — IPN 2021 – 2024 *English B2 → C1 in progress Native Spanish*

CERTIFICATIONS **Ethical Hacker** Cisco Networking Academy (Netacad) *In progress — 2025*

Fundamentals of Deep Learning NVIDIA Deep Learning Institute (DLI) *Completed — Nov/Jan 2026*

Project Management & Agile Fundamentals Santander Open Academy *May–Aug 2025* | *#OA-2025-0802001521370*

WHY ME

Some companies works with Google Cloud Premier Partner, and I have hands-on experience with Google APIs (Gemini, Imagen, Maps SDK). They operate under ISO 27001, and I am currently taking Ethical Hacker training to understand the security of the systems I build. They specialize in intelligent process automation — which is exactly what I have built with n8n, Python, generative AI APIs, and local AI.

I am not looking for a place to learn from scratch. I am looking for a team where what I have already built is the starting point, and where a culture of quality and agile methodologies allows me to grow toward more complex architectures.
